back-perl updates

OpenLDAP Developers' Day
San Francisco 2003
What I did...

• Added more operations
  - extended, connection_destroy, connection_init

• New return-semantics
  - scalar (backwards compat)
  - [code matched errmsg]
  - {code=>$code, text=>$errmsg, matched=>$matched}

• Pass along a connection-like object
Why I did it...

- Transparent policy-proxy for user mgmt
Hmmm...

- More effective entry return mechanism.
  - ber-encoded or ...
  - using callbacks into the backend
- Net::LDAP integration (?)
- ??
